Appendix D Analysis of Transportation Effects

Fehr / Peers

April 4, 2018

Mr. Jose Campos Office of Community Investment and Infrastructure 1 South Van Ness Avenue, 5th Floor San Francisco, CA 94103

Subject: Analysis of Transportation Effects of Project Refinements to the Candlestick Point/Hunters Point Shipyard Phase II Project Since Certification of the Project's Final EIR (Addendum 5)

Dear Joy:

As you know, the *Candlestick Point/Hunters Point Shipyard Phase II Project Final EIR* (herein referred to simply as "EIR") was certified by the San Francisco Planning Commission and the San Francisco Redevelopment Commission in June 2010. The EIR analyzed the originally-proposed project (as described in Chapter II of the FEIR, hereinafter referred to as "FEIR Project"), several variants (as described in Chapter IV of the FEIR), and several alternatives (as described in Chapter VI of the FEIR). The City's subsequent actions approved a subset of the options analyzed in the EIR, including:

- 1. The Project with a stadium, with Candlestick Tower Variant 3D, Utilities Variant 4, and Shared Stadium Variant 5;
- 2. The Project without the stadium, with Non-Stadium R&D Variant 1, Candlestick Tower Variant 3D, and Utilities Variant 4;
- 3. The Project without the stadium, with Non-Stadium Housing Variant 2, Non-Stadium Housing/R&D Variant 2a, Candlestick Tower Variant 3D, and Utilities Variant 4; and
- 4. Sub-alternative 4A, which provides for the preservation of four historic structures in HPS2; Sub-alternative 4A could be implemented with either the stadium Variants or non-stadium Variants (see Board of Supervisors CEQA Findings pp. 2–4).

Since the certification of the EIR, a number of refinements have been proposed to the FEIR Project. Modifications to the FEIR Project 2010 Phasing Schedule and the schedules for implementation of the Transportation Plan and other public benefits were analyzed in Addendum 1, published on December 11, 2013, and approved by various City agencies and OCII in 2014. Addendum 4, published on February 22, 2016, analyzed modifications to the CP Design for Development and certain transportation system changes that required modification of several CP-HPS2 Project plan documents. These modifications were approved in 2016. (The same City agencies also approved

Mr. Jose Campos April 4, 2018 Page 2 of 68

FEIR Addenda 2 and 3; however, FEIR Addendum 2 is no longer applicable to the Modified Project and Addendum 3 did not modify any portion of the project affecting the transportation network or affect any transportation impact analysis, and thus are not discussed further.)

The Modified Project, as proposed in this analysis, is most similar in land uses to Non-Stadium R&D Variant 1, listed above. This letter summarizes a review of the proposed refinements to determine whether and to what extent they would change conclusions regarding significant transportation-related impacts and associated mitigation measures as described in the EIR.

PROJECT MODIFICATIONS

Table 1 highlights the Addendum 5 transportation-related revisions as well as other previously analyzed and approved revisions from prior addenda, followed by a brief description of the changes. **Table 2** summarizes the Modified Project proposed land uses at Candlestick Point and at Hunters Point Shipyard (herein referred to as "CP" and "HPS," respectively). A detailed comparison of the modified land uses to the FEIR Project, FEIR Variant 1 (R&D), and FEIR Variant 2A (Housing/R&D) is provided in **Appendix A**. Compared to FEIR Variant 1, the Modified Project would reduce the number of housing units in CP by 632 housing units, relocating those units at HP. Additionally in HPS, the Modified Project would add a 175-room hotel, add 410,000 square feet of institutional/educational uses, reduce R&D/Office in HPS from 5,000,000 square feet to 4,265,000 square feet, and increase the retail/maker space in HPS from 125,000 square feet to 401,000 square feet (71,000 square feet of the retail in HPS would be retail that was previously approved and no longer planned to be built as part of HPS Phase 1). HPS would also include an additional 172 housing units that were previously approved but no longer planned to be built as part of HPS Phase 1. The Modified Project site plan is shown in **Figure 1**.

		TABLE 1: PROJ	ECT DESCRIPTION REVISIONS								
Project Description		Change from FEIR Assumptions for Variant 1 (R&D)									
Component	Addendum 1 ¹	Addendum 2	Addendum 3	Addendum 4 ²	Addendum 5						
Land Use	No Change	Project change involved implementation of an Automated Waste Collection System to	Project change does not impact	 Convert 15.5 ksf of office to 6 ksf of local serving retail Convert 42 ksf of performance venue space to 1,200-seat (42 ksf) cinema All other uses (and balance of office and performance venue space) to remain unchanged Reduce the number of seats in the performance venue from 10,000 to 5,600 (including a Performance Arts Center and a Film Arts Center) 	 FEIR Variant 1 (R&D) land uses, plus the following changes: Reduce R&D/Office from 5,000,000 square feet to 4,265,000 square feet at HP Add a 175-room hotel at HP Add 410,000 square feet of institutional/educational uses at HP Increase the retail/maker space from 125,000 square feet to 401,000 square feet at HP Relocation of 632 housing units from CP to HP Addition of 172 additional residential dwelling units at HP previously approved but no longer planned to be built as part of HP Phase 1 						
Construction Phasing	Generally accelerated construction within Candlestick Point, including the regional retail center, and postponed construction within Hunters Point Shipyard. As a result of changes to development phasing, also included changes to phasing of internal transportation infrastructure, off-site roadway improvements, and transit service improvements.	That system is no longer proposed and the effects studied in Addendum 2 are no longer applicable to the Modified Project.	transportation assumptions or conclusions	No changes to project construction phasing compared to Addendum 1. EIR analyzed an initial and long-term configuration for Harney Way. Addendum 4 analyzed the effects of splitting construction of the initial configuration into two phases. Attachment A in the transportation assessment included with Addendum 4 illustrates the initial configuration.	Same land uses within CP as FEIR Variant 1 (with the exception of 632 residential units relocated from CP to HP as part of the Modified Project), but with similar construction phasing to Addendum 1 (i.e., overall acceleration of construction at CP). Within HP, as a result of additional changes to development phasing, more substantial changes to construction phasing, including internal transportation infrastructure, off-site roadway improvements, and transit service improvements						

P

Mr. Jose Campos April 4, 2018 Page 4 of 68					F
		TABLE 1: PROJ	ECT DESCRIPTION REVISIONS		
Roadway Geometry					
Roadway Cross Sections	A number of changes to roadway cross- sections based on need to align roadways and standardize lane widths per SFMTA direction.			Additional changes to lane, sidewalk, and median widths to accommodate storm- water treatment and fire department requirements. Number of lanes and facility capacity generally remained unchanged. Attachment C of the transportation assessment included with Addendum 4 includes a cross-section comparison figure.	No changes in CP compared to Addendum 4. Changes in HPS South associated with re- orientation of street grid. Changes in R&D and HPS North associated with improvements to bicycle network to connect cycletrack through entire CP site, as well as to provide transit-only lanes on Lockwood Avenue. Generally, street design principles remain unchanged and facility capacity generally remains unchanged. Appendix D includes the revised cross-sections.
Gilman Avenue	No Change	Project change involved implementation of an Automated Waste Collection System to serve the entire project site, including very minor effects to the transportation system. That system is no longer proposed and the effects studied in Addendum 2 are no longer applicable to the Modified Project.	Project change does not impact transportation assumptions or conclusions	Reconfigure the Gilman Avenue cross- section between Third Street and Arelious Walker. The cross-section would be revised to increase the sidewalk width and decrease the number of travel lanes from two lanes to one lane in each direction. Parking would remain on both sides of the street. Attachment D of the transportation assessment included with Addendum 4 illustrates the revised cross-section.	No change compared to Addendum 4
Roadway Alignment	Revised roadway alignment to accommodate changes to BRT alignment.			No changes to roadway alignment compared to Addendum 1.	Updated alignment of internal streets in HPS South associated with reorientation of street grid. Modified Project now also includes optional extension of Donahue Avenue from its current terminus south to connect to Crisp Avenue.
Yosemite Slough Bridge	Widen the bridge by four feet from the previously-approved non-stadium project alternative, to accommodate bicycle and pedestrian circulation on both sides of the bridge. Total width still within the maximum width evaluated in the EIR for the Stadium Alternative.			No additional changes to Yosemite Slough Bridge cross-section since Addendum 1.	No additional changes to Yosemite Slough Bridge cross-section since Addendum 1.

	TABLE 1: PROJECT DESCRIPTION REVISIONS									
Transit										
BRT Alignment	Convert proposed BRT lanes from a two- way, side-running alignment to a center- running alignment, where possible. At the Candlestick Point site, the BRT lanes would be re-oriented such that both BRT lanes are on the west side of the Wedge Park.			No additional changes to BRT alignmer since Addendum 1.						
29 Sunset	Minor re-routing through Candlestick Point.			No additional changes to the 29-Sunse route since Addendum 1.						
Hunters Point Shipyard Transit Center	Relocate the Hunters Point Transit Center one block north from the originally proposed location, resulting in re-routing all bus routes traversing the transit center.			No additional changes to the Hunters Point Shipyard Transit Center or transi routes since Addendum 1.						
Bicycle Network	Refine the bicycle network including the addition of a cycle track near the Candlestick Point Retail Center. The cycle track would replace the Class II bike lanes originally proposed on Arelious Walker and Harney Way.	Project change involved implementation of an Automated Waste Collection System to serve the entire project site, including very minor effects to the transportation system. That system is no longer proposed and the effects studied in Addendum 2 are no longer applicable to the Modified Project.	Project change does not impact transportation assumptions or conclusions	Minor bicycle network refinement. Repla Class III sharrows with Class II bike lanes Earl Street. Attachment H of the Transportation Assessment included wit Addendum 4 shows the revisions to the bicycle network.						
Pedestrian Network	Minor refinements to the pedestrian network.			Addition of sidewalk on the west-side of Arelious Walker, between Jamestown Avenue and Ingerson Avenue. Other min changes to sidewalk widths to accommodate storm-water runoff, as noted above.						

Page 6 of 68				T
		TABLE 1: PRO.	JECT DESCRIPTION REVISIONS	
Parking	Minor refinement to the total parking supply. Generally the Project would supply parking within the range contemplated in the EIR (2,800 to 20,000 on- and/or off- street parking spaces).		Minor increases to the total off-street parking supply to account for loss of anticipated on-street parking. Accomplished through modifications to parking rates outlined in the D4D. Total parking supply is similar to what was initially contemplated in the EIR.	Minor changes to total supply associated with minor changes in land use and refinements to street and intersection designs. Decrease of approximately 725 spaces in Hunters Point and a decrease of approximately 250 in Candlestick Point compared to FEIR Variant 1 (R&D). No changes to maximum parking rates by land use, however. Generally, the Project would supply parking within the range contemplated in the EIR for Variant 1 (R&D) (3,000 to 23,000 on- and/or off- street parking spaces).
Loading	No Changes		No Changes	No Changes

6

Notes:

Detailed changes to the Project Description are described in Addendum 1, dated December 11, 2013.
 Addendum 4 did not propose revisions that would affect the transportation system or analysis at the Hunters Point Shipyard site. Detailed changes to the Project Description are described in Addendum 4, dated February 22, 2016.

TABLE	2
-------	---

MODIFIED PROJECT PROPOSED LAND USES

	FI	FEIR Variant 1 (R&D)				Modified Project			
Land Use Program	СР		HPS		СР		HPS		
	Size	Units	Size	Units	Size	Units	Size	Units	
Residential ¹	7,850	units	2,650	units	7,218	units	3,454	units	
Neighborhood Retail/Maker Space ^{1,2}	125	ksf	125	ksf	125	ksf	301	ksf	
Regional Retail	635	ksf		ksf	635	ksf	100	ksf	
Office	150	ksf		ksf	150	ksf		ksf	
Hotel	220	rooms		rooms	220	rooms	175	rooms	
Community Services	50	ksf	50	ksf	50	ksf	50	ksf	
Park	147	acres	238	acres	105.7	acres	337.7	acres	
Arena	10,000	seats		seats	10,000	seats		seats	
R&D		ksf	5,000	ksf		ksf	4,265	ksf	
Artists' Studios		ksf	255	ksf		ksf	255	ksf

Institutional (Jr. HS/HS)		students		students		students	1,000 ³	students	
Institutional (HS/Post-Secondary)		students		students		students	1,000 ³	students	

 The total amount of proposed land development for HPS Phase 2 shown in Table 2 includes 71 ksf of additional retail space and 172 additional dwelling units that will no longer be included as part of the HPS Phase 1 development, and therefore, would not represent "net new" approved development within the overall HPS Plan Area.

2. 75 ksf of the 301 ksf of Neighborhood Retail at HPS would be dedicated for maker space uses.

 Includes 600 HS students and 400 college students. Half of the HS students would be on site at any given time. Only 1/3 of college students would be on site at any one time.

Figure 1 Modified Project Site Plan

Mr. Jose Campos April 4, 2018 Page 9 of 68

TRAVEL DEMAND

Fehr & Peers conducted a detailed travel demand forecast of the Modified Project land uses using the same methods as described in the EIR. As noted earlier, the FEIR analyzed the FEIR Project as well as several variants and alternatives to the originally-proposed project. The land uses and travel demand characteristics of the Modified Project are similar to FEIR Variant 1 (R&D). Therefore, **Table 3**, below, compares the travel demand forecasts for the Modified Project with both the FIER Project and FEIR Variant 1 (R&D). Detailed calculation sheets are provided in **Appendix B**.

TABLE 3 TRAVEL DEMAND FORECAST COMPARISON (VEHICLE TRIPS)									
FEIR ProjectFEIR Variant 1 (R&D)Modified ProjectDifference from FEIR Variant 1 									
	СР	2,310	2,310	2,264	-46				
AM Peak Hour	HP	1,924	3,065	3,212	+147				
	Total	4,234	5,375	5,476	+101 ¹				
	СР	4,913	4,913	4,882	-31				
PM Peak Hour	HP	2,164	3,134	3,644	+510				
	Total	7,077	8,047	8,526	+479				

Notes:

1. Increases in trips associated with the Modified Project include approximately 100 AM peak hour and 200 PM peak hour vehicle trips for 172 dwelling units and 71 ksf of retail space. These new trips would not affect the total amount of traffic in the area at Project buildout because they correspond to the number of units and commercial square footage approved but not built, and no longer planned to be built, as part of the adjacent HPS Phase 1 project; however, they do represent an increase in the number of trips that are considered a part of the Modified Project. Thus, although the Modified Project's contribution in traffic is expected to increase by approximately 100 to 480 vehicle trips in the AM and PM peak hours, respectively, the total traffic volume in the area is expected to be nearly identical to the FEIR in the AM peak hour and increase by approximately 280 trips in the PM peak hour, since the other vehicle trips were previously accounted for as part of Phase 1.

Mr. Jose Campos April 4, 2018 Page 10 of 68

As shown, the Modified Project would generate approximately 100 more vehicle trips overall in the AM peak hour (although it would generate approximately 150 more vehicle trips at Hunters Point Shipyard, which would be offset by a decrease of nearly 50 vehicle trips at Candlestick Point). In the PM peak hour, it would generate approximately 480 peak hour vehicle trips more than FEIR Variant 1, which includes an increase of approximately 500 trips at Hunters Point and a decrease of approximately 30 trips at Candlestick Point. Overall, the changes compared to Variant 1 represent an increase of 1.9 percent in vehicle trips during the AM peak hour and an increase of 6.0 percent during the PM peak hour associated with the Modified Project. In reviewing these numbers it is important to recall that nearly all of the AM peak hour increase and approximately 40 percent of the PM peak hour increase is due to land uses that were previously considered as part of Phase 1 and which are now considered part of the Modified Project. Thus, the overall increase in traffic in the area associated with the Modified Project is essentially nothing in the AM peak hour and 3.5 percent in the PM peak hour, even though the Modified Project's portion of the total traffic generated is higher.

Tables 4 and 5, below, summarize the change in transit travel demand associated with the Modified Project compared to Variant 1 (R&D). As shown, the Modified Project would generate slightly fewer transit trips than Variant 1 (R&D) from the EIR, although demand would increase slightly inbound to the HP and CP sites and decrease slightly outbound from the site in the AM peak hour compared to Variant 1 (R&D). The reverse phenomenon occurs in the PM peak hour.

TABLE 4 TRAVEL DEMAND FORECAST COMPARISON (TRANSIT TRIPS)

	Total	1,889	1,486	3,375	1,861	1,571	3,433			

Below is a discussion of the effects of the proposed changes on the impacts identified in the EIR.

IMPACT TR-1: ON-SITE AND OFF-SITE CONSTRUCTION IMPACTS

As described in the EIR, construction of the Project would result in transportation impacts in the Project vicinity due to construction vehicle traffic and roadway construction and would contribute to cumulative construction impacts in the Project vicinity. The EIR concluded implementation of mitigation measure MM TR-1, which would require the Applicant to develop and implement a construction traffic management plan to reduce the impact of construction activity on transportation facilities, would reduce the impacts caused by construction, but not to a less-than-significant level.

The overall amount of construction anticipated to occur as part of the Modified Project will be the same as or less than originally conceived and described for the FEIR Project, although the sequencing may be somewhat different. The FEIR Project analysis anticipated development phasing that would create more construction activities in the Hunters Point Shipyard in the early years of project buildout, with higher construction levels in Candlestick Point during later phases. Additionally, the FEIR Project also included construction of a new NFL stadium in the very early phases of development, which would have resulted in much more intense construction activities then will likely ever occur during any of the non-stadium options.

Mr. Jose Campos April 4, 2018 Page 12 of 68

The revised phasing proposed for the Modified Project will reverse this, with more construction activities in Candlestick Point during the earlier years and more activity in the Hunters Point Shipyard site during later years. Further, because the Modified Project does not include a new NFL stadium, the overall construction activities will be more spread out over time and well below the peak levels anticipated for the FEIR Project.

Although the latest proposed phasing at Candlestick Point is slightly different from previous analyses of accelerated construction at Candlestick Point, such as the evaluation outlined in EIR Addendum 1, the overall construction activities and general proposal is similar to what was analyzed in EIR Addendum 1. Portions of the construction outlined in Addendum 1, including demolition of Candlestick Park, have already occurred. Postponement of construction in Hunters Point Shipyard is primarily a result of delays in transferring land from the US Navy to the City and County of San Francisco. An estimate of construction activities during the course of project buildout associated with the FEIR Project and the Modified Project, as well as a chart illustrating the difference in terms of construction truck trips over time between the two, is provided in **Appendix C**.

Overall, although the timing and location of construction activities may vary within the site compared to what was originally anticipated, the construction activities are expected to create similar or even less intense significant and unavoidable localized construction-related traffic impacts as were originally described in Impact TR-1 the EIR. Mitigation measure MM-TR-1, development of a Construction Traffic Management Program, would still apply, although impacts would continue to remain significant and unavoidable.

Therefore, construction of the Modified Project would not result in any new significant effects to transportation beyond those identified in the EIR nor would they result in a substantial increase in the severity of a significant impact, and no new mitigation measures would be required.

IMPACTS TR-2 THROUGH TR-16: TRAFFIC IMPACTS TO REGIONAL AND LOCAL ROADWAY SYSTEM, STUDY INTERSECTIONS, AND FREEWAY FACILITIES

As described in the EIR, the Project would generate substantial amounts of new vehicular traffic resulting in a number of significant impacts and mitigation measures. More specifically, the EIR identified Impact TR-2, a significant impact related to the Project's overall increase in traffic generation in relation to the current roadway system capacity. The EIR identified Mitigation Measure MM TR-2, the development and implementation of the Project's Transportation Demand

Mr. Jose Campos April 4, 2018 Page 13 of 68

Management (TDM) plan as a means to lessen the severity of Project-generated traffic impact; however, Impact TR-2 would remain significant and unavoidable with mitigation.

The EIR identified Impacts TR-3 through TR-8, which described locations where the Project would create new project-related impacts or contribute to significant cumulative impacts at study intersections. Mitigation Measures MM TR-4 (restriping at the intersection of Tunnel/Blanken), MM TR-6 (participating in the bi-county study and paying a fair share contribution toward improvements near the Geneva Avenue/US 101 interchange), MM TR-7 (restriping at the Amador/Cargo Way intersection), and MM TR-8 (participating in the bi-county study and paying a fair share contribution toward improvements near the severity of Project-related impacts. However, due to uncertainty regarding implementation of mitigation measures, Impacts TR-3 through TR-8 were determined to remain significant and unavoidable with mitigation. The EIR also identified Impact TR-9, which described the project's less than significant impact to a number of other study intersections.

At a slightly larger scale, the EIR identified Impact TR-10, which describes the effect of Projectrelated traffic spilling over into nearby residential neighborhood streets. The EIR determined this impact to be significant, and referenced other mitigation measures described elsewhere in the EIR (including Mitigation Measure MM TR-2, the development and implementation of a TDM Plan) as appropriate strategies to reduce the severity of Impact TR-10. However, the EIR determined that the impact would remain significant and unavoidable with mitigation.

The EIR also identified a number of significant Project-related impacts to freeway facilities, including Impacts TR-11 through TR-15. No feasible mitigation measures were identified for Impacts TR-11 through TR-13 and these impacts would be significant and unavoidable. Mitigation Measures MM TR-14 and MM TR-15, which called for participation in the bi-county study and payment of a fair share contribution toward improvements near the Geneva Avenue / US 101 interchange area, were identified to reduce the severity of Impacts TR-14 and TR-15; however, since the implementation of these measures was uncertain, Impacts TR-14 and TR-15 would also remain significant and unavoidable.

Finally, the EIR identified Impact TR-16, a significant impact associated with the Project's contribution to traffic on Harney Way, which will be a primary access route for all modes between the Project site and regional transportation facilities (US 101, Bayshore Caltrain, Balboa Park BART, the Bay Trail, etc.). Mitigation Measure MM TR-16 called for the project to construct the initial

Mr. Jose Campos April 4, 2018 Page 14 of 68

phase of Harney Way at the outset of construction of the first major phase, which would reduce the Project's impact to less than significant.

However, as shown in Tables 3 and 4, the Modified Project would be most similar to FEIR Variant 1 (R&D) in terms of vehicle trips generated. The EIR also included a discussion of how the transportation impacts associated with Variant 1 (R&D) would be different from those of the FEIR Project summarized above. As noted in the EIR (pp. IV-18-IV-21), in addition to the same significant impacts as the FEIR Project, Project Variant 1 (R&D) would also have significant project-level or cumulative impacts on five intersections that would not occur with the FEIR Project. Specifically, FEIR Variant 1 (R&D) would have significant and unavoidable impacts at three additional intersections:

- Ingalls Street / Carrol Avenue
- Bayshore Boulevard / Oakdale Street
- Evans Avenue / Jennings Street

FEIR Variant 1 (R&D) would also have significant impacts at two additional intersections that could be reduced to less than significant levels with mitigation:

- Crisp Road / Palou Avenue / Griffith Street
- Innes Avenue / Earl Street

Mitigation at Crisp Road / Palou Avenue / Griffith Street identified in the EIR for Variant 1 (R&D) would involve re-striping the southbound approach to provide a dedicated left-turn lane and a shared through/right-turn lane, and prohibiting on-street parking on Griffith Street between Palou Avenue and Oakdale Avenue.

Mitigation at Innes Avenue / Earl Street identified in the EIR for Variant 1 (R&D) would involve constructing a new traffic signal at the intersection. Subsequent to the preparation of the EIR, the India Basin project has been proposed, and as of the writing of this analysis, that project has published a Draft EIR for public review and comment. The India Basin project includes construction of a traffic signal at this intersection.

There are two components to the discussion of the Modified Project's traffic impacts: one component addresses how project refinements would affect impacts under long-term buildout

Mr. Jose Campos April 4, 2018 Page 15 of 68

conditions (similar to the conditions analyzed in the EIR) and the other component addresses how changes to project phasing would affect auto access to the site during the buildout period.

Buildout Conditions

The EIR's discussion of traffic impacts is based on project buildout. Refinements have been made to the internal roadway network, both to cross-section dimensions and roadway alignments. Refinements to roadway cross sections have been made to continue to encourage slow-speed auto traffic, but also to better accommodate transit, bicyclists, and on-street parking based on recent SFMTA design guidance for travel lane widths. Some of these changes have been discussed in prior addenda. Specifically, Addendum 1 (p. 10) described some general categories of modifications, such as establishing consistent design principles, establishing a more consistent BRT alignment, the design of the Yosemite Slough Bridge, and reorientation of some streets in Candlestick Point. These principles have not changed since Addendum 1, although some additional modifications to cross-sections have been proposed as a consequence of modification of some roadway alignments in HPS. Revised cross-sections associated with the Modified Project are presented in **Appendix D**.

However, other principles affecting the roadway designs described in Addendum 1, such as the revised bicycle network and the re-orientation of the street grid in Hunters Point South are no longer directly applicable, and additional modification is proposed as part of the Modified Project. Those elements are described generally below:

• **Revised bicycle network.** Project modifications described in Addendum 1 included a new cycletrack facility that closed a gap in the bicycle network near the project's retail center. The cycletrack would extend west of the project site, along Harney Way toward US 101¹ replacing the originally-proposed Class II bicycle lanes on both sides of the street. The cycletrack was also anticipated to travel along Crisp Road in Hunters Point Shipyard, before terminating near Spear Avenue. The modifications described in Addendum 1 related to the bicycle network revisions in Candlestick Point remain unchanged since Addendum 1.

¹ The EIR anticipated that Harney Way would be constructed in two phases. The first phase would construct two auto travel lanes in each direction (with two BRT lanes, on-street bicycle lanes, and a center turn lane). The changes proposed for the initial configuration of Harney Way do not affect auto capacity, but rather use land reserved for potential future expansion to extend the two-way Class I cycletrack from the project site west toward the Bay Trail. The Class I cycletrack would be removed if Harney Way were widened to its ultimate width because of the need for auto capacity. Under these circumstances, bicycle conditions along Harney Way would be identical to what was originally approved in the EIR.

Mr. Jose Campos April 4, 2018 Page 16 of 68

Refer to Addendum 1, p. 26 for a comparison of the FEIR Project and the Addendum 1 refinements to the bicycle network. However, the Modified Project proposes to realign the cycletrack through HPS such that it traverses the open space to the south of Crisp Road, and then uses a neighborhood midblock break in Hunters Point South to travel parallel to Crisp Road. Refer to the bicycle impacts section of this letter for further discussion of the changes to the bicycle network.

- Reorientation of Street Grid in Hunters Point South. Streets in the Hunters Point South neighborhood associated with the Modified Project are similar to what was proposed in FEIR Variant 1 (R&D) (FEIR Figure IV-1, p. IV-7), but street alignments have been slightly modified to account for retention of some additional existing buildings. Overall, the size and density of the street grid in Hunters Point South is similar to what was originally approved in FEIR Variant 1 (R&D) and therefore, transportation capacity is expected to be similar.
- Extension of Donahue Street south to Crisp Road. Within Hunters Point, the originallyproposed Project provided one travel route to the north (via Donahue and Innes Avenue) and one travel route to the south (via Crisp Road and Palou Avenue). Travelers on the northern side of the Hunters Point Shipyard who wanted to travel south would have to travel through the entire Shipyard site to reach Crisp Avenue and Palou Avenue. Similarly, travelers in the southern part of Hunters Point who wish to travel north, would have to travel through the entire site to get to Innes Avenue. The extension of Donahue Street would provide a direct connection between Crisp Avenue and Innes Avenue, allowing for less circuitous travel and fewer vehicle trips through the center of the Shipyard site.

Although most roadway cross-section refinements consist of relatively minor modifications to the roadway network to accommodate refined bus circulation, bicycle networks, and pedestrian amenities as described above, one refinement is proposed – to Arelious Walker Drive – that does affect vehicular capacity at buildout. That refinement would reduce the ultimate width of the street from six lanes to four lanes, and would remove on-street parking and Class II bike lanes (to be replaced by the Class I cycletrack discussed elsewhere). This proposed change was evaluated and approved in Addendum 1, and found to continue to provide acceptable vehicular capacity for the refined land uses evaluated in Addendum 1. This change is also included in the Modified Project,

Mr. Jose Campos April 4, 2018 Page 17 of 68

and the evaluation discussed in this section assesses the degree to which this change would continue to provide acceptable vehicular capacity for the Modified Project.

The EIR assessed cumulative (year 2030) weekday AM and PM peak hour intersection turning movement volumes for approximately 60 study intersections, assuming the development of the FIER Project (and numerous variants and alternatives), a number of adjacent planned projects, and some background traffic growth on area roadways. The operating characteristics of these study intersections were described in terms of Level of Service ("LOS")².

Because the Modified Project results in changes to the overall peak hour travel demand and includes some modifications that affect vehicular capacity, as noted above, this assessment includes a LOS analysis at a subset of intersections closest to the Modified Project site to assess the degree to which the Modified Project may affect impact determinations identified in the EIR. The subset of intersections evaluated is expected to include the intersections that experience the majority of project-related traffic volume changes, as they are closer to the project site where traffic is less dispersed. If changes to delay and LOS at these intersections are relatively small, it can reasonably be concluded that changes to other intersections further away from the project site would be even smaller.

Below, **Table 6** summarizes the intersection LOS for intersections nearest to the project site at full project buildout as described for Variant 1 (R&D) in the EIR and as forecasted with the Modified Project, including the proposed change to the ultimate configuration of Arelious Walker Drive (i.e., two through lanes in each direction instead of three). As shown, the Modified Project would have only minor effects to the intersection LOS analysis compared to Variant 1 (R&D) as outlined in the EIR. No intersections that operate at LOS D or better under Variant 1 (R&D) would deteriorate to LOS E or F, or deteriorate from LOS E under Variant 1 (R&D) to LOS F. Furthermore, the intersections forecasted to operate at LOS E or F under conditions with Variant 1 (R&D) would continue to operate at LOS E or F, respectively under the Modified Project. Volume to capacity ratios at each of the intersections forecasted to operate at LOS F with delays over 80 seconds per

² LOS is a qualitative description of an intersection's performance based on the average delay of per vehicles traveling through it. Intersection levels of service range from "A", which indicates free flow or excellent conditions with short delays, to LOS F, which indicates congested or overloaded conditions with extremely long delays. LOS A through D are considered excellent to satisfactory service levels.

TABLE 6 INTERSECTION OPERATIONS									
	FE	IR Variant	t 1 (R&D) ²	,3,4		Modified	Project ^{2,3}

Notes:

1. Intersection numbers are based on EIR intersection numbering for reference and comparison purposes.

2. Delay in seconds per vehicle. For side-street stop controlled intersections, delay and LOS presented for the worst approach and indicated in parenthesis. For intersections operating at LOS F, delay calculations are not relevant, based on the HCM methodology, and therefore, delay is simply reported as greater than 80 seconds per vehicle. To allow for comparison in operating conditions at intersections operating at LOS F, the volume to capacity ratio (V/C) is also shown.

3. Intersections operating at LOS E or F shown in **bold**.

- 4. Refer to Tables 45 and 46, on pp. 167-172 of the Project's Transportation Impact Study, included as Appendix D to the FEIR, for LOS results for FEIR Variant 1 (R&D).
- 5. The analysis of conditions with the Modified Project at Gilman / Third and Gilman / Arelious Walker was performed using a more detailed and sophisticated software, the Synchro platform, than what was used in the FEIR in order to capture unique features of those intersections. Analysis of Modified Project conditions at Gilman / Third also reflects updated lane configurations established by SFMTA subsequent to publication of the EIR.
- 6. The EIR-reported calculation of LOS for the intersection of Innes Avenue / Earl Street in Table 46 on pp. 170-172 in the Transportation Impact Study included a typographical error. The error did not affect the conclusion of the EIR with respect to significant impacts. The correct LOS is included here.

Mr. Jose Campos April 4, 2018 Page 19 of 68

vehicle would change only slightly at all intersections, indicating little change in operating conditions at these intersections, with the exception of Palou Avenue / Third Street in the PM peak hour. At Palou Avenue / Third Street, the v/c ratio would increase from 2.22 and 5.97 to 2.47 to 6.65 with the Modified Project in the AM and PM peak hours, respectively – an increase of approximately 10 percent. Overall, the Modified Project would increase volumes by approximately 14 vehicles in the AM peak hour and 87 vehicles in the PM peak hour, an increase of less than 0.3 percent in the AM peak hour and 1.5 percent in the PM peak hour. This increase in traffic volumes is well within the range of error of the project's travel demand forecasts³ and is therefore not likely to create a perceptible difference for users.

Finally, as shown in Table 6 for Intersections #29 and #34, the proposed reduction in travel lanes from six to four lanes on Arelious Walker Drive that was first proposed in Addendum 1 would continue to provide for acceptable intersection operations under the Modified Project. Detailed intersection LOS calculations are included in **Appendix E**.

As noted above, significant impacts at the intersections of Crisp / Palou and Innes / Earl were able to be reduced to less than significant with mitigation measures identified specifically for Variant 1 (R&D) in the EIR. Implementation of the traffic signal at the intersection of Innes / Earl, as identified in the EIR, would continue to reduce impacts at this intersection to less than significant levels with the Modified Project.

However, the mitigation measure identified for Crisp / Palou would not be sufficient to reduce the impacts associated with the Modified Project to less than significant levels. As a result, a revised mitigation measure at this intersection would be required to achieve acceptable operations and reduce the impacts at this intersection to less than significant levels.

Therefore, the paragraph in the EIR describing the mitigation measure at this intersection (p. IV-19) should be revised, as follows:

³ Refer to *Trip Generation*, 9th Edition, Institute of Transportation Engineers, which was the source of the data used in this study for forecasting trip generation, and is widely used in the industry. Generally, forecasts from this source are based average rates or fitted curve equations based on a set of observed data. However, the standard deviation of the data to the rates or equations is greater than two percent in virtually every land use category.

Mr. Jose Campos April 4, 2018 Page 20 of 68

Striping the southbound approach to provide a dedicated <u>leftright</u>-turn lane and a shared through/<u>rightleft</u>-turn lane, <u>and</u>_prohibiting on-street parking on Griffith Street between Palou Avenue and Oakdale Avenue, <u>and constructing the westbound approach on Crisp</u> <u>Avenue to provide two dedicated left-turn lanes and one shared through/right-turn lane</u> would result in an LOS D at the intersection. Implementation of this improvement would be the responsibility of SFMTA and DPW, the Project Applicant shall contribute its fair-share toward construction of the mitigation measure. Prior to payment of the contribution, the City shall create a mechanism to determine and receive fair share contributions from the Project Applicant. The SFMTA and DPW shall design and implement the measure as necessary.

Table 7, below, shows the operation of these two intersections with the mitigation measures as described above. With mitigation measures, these two intersections would operate acceptably and the impacts associated with the Modified Project would be less than significant, similar to the conclusions in the FEIR for Variant 1 (R&D).

TABLE 7 INTERSECTION OPERATIONS WITH MITIGATION								
		Modified	Project ^{2,3}		Modified Project With Mitigation ^{2,3}			
Intersection ¹	AM Peak Hour		PM Peak Hour		AM Peak Hour		PM Peak Hour	
	Delay / LOS	V/C	Delay / LOS	V/C	Delay / LOS	V/C	Delay / LOS	V/C
#30 – Crisp / Palou	>80 / F	1.12	>80 /F	1.21	33 / C	0.86	36 / D	0.85
#47 – Innes Ave / Earl	7 - Innes Ave / Earl 1 (24) / A (C) ⁴ 4 (77) / A (F) ⁴ 18 / B 21 / C							

Notes:

1. Intersection numbers are based on EIR intersection numbering for reference and comparison purposes.

2. Delay in seconds per vehicle. For side-street stop controlled intersections, delay and LOS presented for the worst approach and indicated in parenthesis. For intersections operating at LOS F, delay calculations are not relevant, based on the HCM methodology, and therefore, delay is simply reported as greater than 80 seconds per vehicle. To allow for comparison in operating conditions at intersections operating at LOS F, the volume to capacity ratio (V/C) is also shown.

3. Intersections operating at LOS E or F shown in **bold**.

4. The EIR-reported calculation of LOS for the intersection of Innes Avenue / Earl Street in Table 46 on pp. 170-172 in the Transportation Impact Study included a typographical error. The error did not affect the conclusion of the EIR with respect to significant impacts. The correct LOS is included here.

Mr. Jose Campos April 4, 2018 Page 21 of 68

Therefore, because travel demand would be similar to that identified for Variant 1 (R&D) in the EIR, there would be no changes to auto capacity associated with project refinements that result in additional or more severe significant impacts, and intersection LOS would be similar to that identified in the EIR for Variant 1 (R&D) with some minor revisions to one of the mitigation measures identified in the EIR, the Modified Project would have similar impact conclusions for Impacts TR-2 through TR-16, as applied to Variant 1 (R&D) in the EIR. Mitigation measures MM TR-2, MM TR-4, MM TR-6, MM TR-7, MM TR-8, and MM TR-16 will continue to apply, including the additional locations identified for Variant 1 (R&D) in the EIR, revised as noted above.

Timing of Traffic Improvements

Although, for purposes of assessing transportation impacts, the Modified Project will be similar to FEIR Variant 1 (R&D) at buildout, the project development phasing has changed. The phasing of traffic improvements was set forth in a memorandum included as Appendix A4 to the FEIR Comments & Responses⁴. An analysis of the Modified Project phasing and infrastructure implementation timing was conducted to determine whether the Modified Project would provide auto circulation and access at a level adequate to meet the travel demand throughout the buildout period.

Candlestick Point

As noted earlier, development at Candlestick Point is anticipated to occur earlier than originally anticipated. As a result, and to respond to some of the changes in the order of development, revisions to the implementation phasing are proposed to better respond to land use phasing⁵. As shown in **Table 8**, most roadway improvements are scheduled to be implemented at the same triggers or sooner (relative to development levels) than proposed in the EIR, with the exception of Jamestown Avenue and Ingerson Avenue and the automobile route around Yosemite Slough. However, Jamestown Avenue and Ingerson Avenue improvements are largely streetscape improvements, designed to improve the overall urban design of the streets, and will not affect

⁴ Fehr & Peers, *Roadway and Transit Phasing Plan*, March 17, 2010

⁵ Although previous EIR Addenda also considered revisions to the project phasing compared to what was analyzed in the EIR, the comparison in this Addendum compares the Modified Project with the FEIR Project, and not to previously contemplated revisions.

TABLE 8 PROJECT STREET SEGMENT IMPROVEMENTS - CANDLESTICK POINT												
	Original Non-Stadium Option ^d Modified Project											
Intersection	Improvement	Traffic Volume Trigger? ^c	Trigger	Traffic Volume Trigger? ^c	Trigger ^e

Ingalls Street, Carroll Avenue to Thomas Avenue	See Figures 2.1.2A – 2.1.2G	Yes	3,131 PM Peak Hour Vehicle Trips (CP & HP) ^c	Yes	CP-07 (Approximately 7,600 PM Peak Hour Vehicle Trips, CP & HP) ^c							

a. The cross-section for Yosemite Slough Bridge has been modified from what is shown in the EIR for the Non-Stadium alternative. However, at 45-feet in width, the structure would be smaller than the bridge approved in the Stadium scenario.

b. The isolated intersection analysis conducted for this study shows that the two intersections along Harney Way would operate acceptably with the near-term configuration even with full buildout of the project. However, because Harney Way is part of a complex series of roadway improvements and due to the inherent uncertainty in traffic forecasts, a study will be conducted prior to construction of each development phase to determine whether conditions are better or worse than projected. The results of that study will indicate whether additional development can be accommodated under the near-term configuration while maintaining acceptable LOS or whether widening is required.

c. Based on trip rates by land use used in the EIR for Variant 1 (R&D) and currently-proposed phasing. See Appendix E for LOS calculation showing that approximately 82% of project-related growth (corresponding to approximately 7,600 vehicle trips) can be accommodated at this intersection before significant LOS impacts would occur.

d. As summarized in the FEIR (Comments and Responses, Appendix A4, Roadway and Transit Phasing Plan), Fehr & Peers, March 17, 2010. Note that the "Original Non-Stadium Option" as presented in the FEIR and replicated here is applicable to all non-stadium options.

e. Where multiple triggers are provided, the trigger shall be whichever event occurs first. When a sub-phase is listed as the trigger, the improvement shall be fully constructed and operational prior to occupancy of the sub-phase.

Mr. Jose Campos April 4, 2018 Page 23 of 68

vehicular capacity along the streets, so in terms of assessing traffic impacts, this modification is not material. Furthermore, the need for the auto route around Yosemite Slough is driven by the need for connection between HP and CP. Since development at HP is somewhat delayed compared to the forecasted schedule from the FIER, these improvements are not needed as quickly, and technical analysis has shown that they can be postponed until Subphase CP-07 (see discussion below).

Figures 2 – 4, attached, illustrate the auto access routes that would be available based on the Modified Project development and roadway infrastructure phasing. As shown, the major connections between the Candlestick Point development and the external transportation network are expected to be developed as part of the first Major Phase. These include Arelious Walker Drive, the four-lane internal spine roadway that connects the smaller internal streets to the external roadways connecting to the rest of the City via Carroll Avenue, Gilman Avenue, Ingerson Avenue, and Jamestown Avenue.

Within Major Phase 1 in Candlestick Point, the development will occur in five sub-phases, CP-01 through CP-05. CP-01 is already constructed or under construction, and includes 337 residential dwelling units on the Alice Griffith site, which will generate approximately 100 PM peak hour auto trips, based on the methodology described in the EIR. As part of this sub-phase, a portion of Arelious Walker has been constructed, between Gilman Avenue and Carroll Avenue. Ultimately, as noted earlier, Arelious Walker Drive would be constructed to provide two travel lanes in each direction, separated by a median. However, as part of CP-01, only the two lanes west of the median were constructed. During this initial period, this segment of Arelious Walker provides one travel lane in each direction. Then, during later phases of development, as noted below, the remaining half of Arelious Walker Drive would be constructed such that two auto lanes would be provided in each direction. The construction of this interim portion of Arelious Walker Drive is consistent with and supports the final configuration of Arelious Walker Drive. Refer to Addendum 1 (Appendix A, Sub-Appendix D) for figures showing the interim and final configuration of Arelious Walker Drive.

As proposed, providing only one travel lane in each direction along Arelious Walker Drive is adequate for this small number of units comprising CP-01, and essentially serves to connect the four development blocks together and provide connections to Carroll Avenue and Gilman Avenue, two primary east-west connections to the greater Bayview neighborhood.

P

Figure 2 CP Major Phase 1

Figure 3 CP Major Phase 2

Figure 4 CP Major Phase 3 Mr. Jose Campos April 4, 2018 Page 27 of 68

Sub-phase CP-02 would develop the 635 ksf regional retail center, a 220-room hotel, 419 residential units, 150 ksf of office, and the 10,000-seat arena. To support this large amount of new development, the key transportation infrastructure connecting Candlestick Point to external routes will be constructed, including Harney Way between the retail center and Thomas Mellon Drive and Arelious Walker Drive, between Harney Way and Gilman Avenue. This portion of Arelious Walker Drive would be constructed to its ultimate width of four lanes, and would connect to the interim two-lane portion to the north of Gilman. Harney Way will be constructed to its initial configuration with four lanes, as described in the EIR⁶. Additionally, Gilman Avenue, between Arelious Walker and Third Street would be reconfigured to provide one travel lane in each direction, center turn lanes, on-street parking, and would retain the existing sidewalks on both sides of the street. Intersections along Gilman Avenue would be signalized between Arelious Walker Drive and Third Street⁷.

Note that Mitigation Measure MM TR-16 in the EIR requires Harney Way to be reconstructed prior to the issuance of a grading permit for the first Major Phase of development. As noted in EIR Addendum 1, since the first Sub-phase in Major Phase 1 in Candlestick Point, CP-01, does not connect to Harney Way and improvements to Harney Way would not affect auto capacity associated with CP-01, reconstruction of Harney Way is not necessary for the first subphase of development. Consequently, a modification was proposed to Mitigation Measure MM TR-16 as part of Addendum 1 (and subsequently approved by OCII, as noted earlier) to provide that Harney Way would be constructed such that it is complete prior to the issuance of occupancy permits for the second subphase of Major Phase 1, CP-02. These same revisions addressed in Addendum 1 would continue to apply to the modified Project.

Other than ensuring that other existing east-west streets connect to Arelious Walker Drive, none of the project-proposed improvements to Carroll Avenue, Ingerson Avenue, or Jamestown Avenue will be constructed as part of Sub-phase CP-02. Carroll Avenue is at the northernmost portion of the CP site, and therefore, not likely to be a desirable route to the Candlestick Point retail center, which

⁶ EIR Addendum 4 discussed the potential for the initial phase of Harney Way to be constructed in two sequences corresponding to the need for information from SFMTA regarding the ultimate interim routing of the 28R BRT route. Addendum 4 concluded that since the sequenced construction would still result in the same auto capacity at all times and would still complete the exclusive right of way for the BRT in advance of service, there would be a less than significant impact of this sequencing. The same conclusions still apply to the Modified Project.

⁷ This is different from the EIR proposal for Gilman Avenue. The proposed changes were evaluated in EIR Addendum 4, which showed the revised design would operate similar to the originally-proposed configuration, with less disruption to the neighborhood due to construction.

Mr. Jose Campos April 4, 2018 Page 28 of 68

sits at the southern end of the CP site. Further, improvements proposed for Ingerson Avenue and Jamestown Avenue are generally streetscape improvements designed to improve the attractiveness of the streets and not to increase auto capacity; therefore, for purposes of discussing traffic impacts, the timing of improvements to these streets is not critical and most of the auto capacity connecting the CP site to the external roadway network will be constructed as part of Sub-phase CP-02 with the described improvements to Harney Way and interim improvements to Arelious Walker Drive.

At this point, prior to occupancy of Sub-phase CP-02, with the exception of the interim portion of Arelious Walker Drive between Gilman Avenue and Carroll Avenue, all of the major auto traffic infrastructure in Candlestick Point required to connect project-related traffic to the external roadway network will be constructed, as will most of the off-site capacity enhancements, including Harney Way and Gilman Avenue.

Subphase CP-03 involves construction of the blocks directly opposite the retail center across Ingerson Avenue. No additional transportation improvements are proposed as part of CP-03 because the major improvements needed to serve CP-03 will be constructed earlier, as part of CP-01 and CP-02.

With the opening of CP-04, the first four subphases would generate about 3,750 vehicle trips, which would exceed the trigger point identified in the FEIR of approximately 3,150 vehicle trips that would require improvements to the auto route around the Yosemite Slough, that includes Carroll Avenue, Ingalls Street, Thomas Avenue, and Griffith Avenue⁸. The analysis conducted for the FEIR was based on the original phasing, which as noted earlier, would develop in the Hunters Point Shipyard site faster than currently proposed. As a result, the automobile route around Yosemite Slough was identified as appropriate infrastructure to provide access to Candlestick Point and US 101 from the development at Hunters Point Shipyard. The trigger in the FEIR was identified as the appropriate time when the improvements would be necessary.

However, based on current proposed phasing, the previously-identified trigger point for the auto route around Yosemite Slough would be met with less development in the Hunters Point Shipyard and substantially more development in Candlestick Point than originally anticipated. As a result, there is likely to be less auto demand for travel between the Hunters Point site and US 101 or

⁸ Fehr & Peers, Roadway and Transit Phasing Plan, p.5, Table 4, March 17, 2010

Mr. Jose Campos April 4, 2018 Page 29 of 68

between the Candlestick Point and Hunters Point Shipyard sites, making the auto route around Yosemite Slough less critical at such an early stage.

The improvements around Yosemite Slough would be required when approximately 85 percent of the total forecasted increase in vehicle traffic at the intersection of Carroll Avenue and Ingalls Street would occur. Based on currently-proposed phasing, this would occur around CP-07, which is also when the northern portion of Alice Griffith development adjacent to Carroll Avenue is scheduled to be constructed. Thus, the trigger for improvements to Carroll Avenue and the automobile route around Yosemite Slough has been modified based on the revised phasing. Intersection LOS calculation sheets demonstrating that the intersection would operate acceptably under its current configuration up to approximately 85 percent of the total forecasted growth is provided in **Appendix E**.

The remaining auto capacity enhancements on Arelious Walker Drive, between Gilman Avenue and Carroll Avenue would also be required to be constructed prior to occupancy of Sub-phase CP-07. At the end of Sub-phase CP-06 in Candlestick Point, which represents the condition at which the most traffic would be using the interim portion of Arelious Walker Drive, the intersection of Arelious Walker Drive and Gilman Avenue would operate within acceptable level of service, as shown in **Table 9** below, and therefore, no significant impacts would occur as a result of providing this interim condition through Sub-phases CP-01 through CP-06. Detailed LOS calculations are provided in **Appendix E**.

TABLE 9 INTERIM INTERSECTION OPERATIONS – ARELIOUS WALKER DRIVE					
Intersection	Arelious Walker/Gilman (PM Peak Hour)				
	Delay ¹	LOS ¹			
Interim Condition at completion of CP-06	53	D			
Notes: 1. Intersection level of service (LOS) based on weighted average control delay per vehicle, according to the <i>2000 Highway Capacity Manual</i> .					

Mr. Jose Campos April 4, 2018 Page 30 of 68

As a result, the roadways that facilitate travel between the project site and the external roadway network would generally provide their full capacity prior to any new trips being generated from Major Phase 2, with the exception of the portion of Arelious Walker between Gilman and Carroll. This segment would be widened to its full capacity near the beginning of Major Phase 2, at which point all major roadways in the CP portion of the project site would be at their full capacity. Otherwise, as shown in Figures 3 – 5, Major Phases 2 and 3, would only add internal circulation roadways adjacent to new development parcels to connect to the major roadways built as part of Major Phase 1. As a result, auto capacity in the Candlestick Point area will be greater than or similar to what was described in the EIR throughout the development buildout.

Hunters Point Shipyard

As noted earlier, development at Hunters Point Shipyard is anticipated to occur later than originally anticipated. As a result, and to respond to some of the changes in the order of development, revisions to the FEIR improvement phasing requirements are proposed to better respond to land use phasing. As shown in **Table 10**, similar to the proposed changes at Candlestick Point, all roadway improvements are scheduled to be implemented at the same triggers or sooner (relative to development levels) than proposed in the EIR.

Figures 5 – 7 show the development of land use and roadway infrastructure for Major Phases 1 – 3 for the Hunters Point Shipyard site, respectively. At buildout, the primary access routes to the Hunters Point Shipyard site include the four-lane Innes Avenue and the two-lane Palou Avenue. **Figure 5** illustrates that the primary northern access route to the Shipyard site, Donahue Street and Innes Avenue, would be constructed and connected to the HPS North area as part of Major Phase 1. The main southern access route to the Shipyard Site, Crisp Avenue, would also be constructed as part of Major Phase 1. Improvements to Crisp Avenue, Spear Avenue, and a portion of Robinson Street, and associated internal streets to connect between them, would be constructed as part of Subphase CP-01, prior to any new trips generated by development in the Hunters Point Shipyard site. The remainder of Robinson Street, and improvements to Donahue Street and Innes Avenue would be reconstructed as part of HP-02, when the first nearby developments as part of HP-02 are constructed. With the improvements constructed in HP-02, the roadway network will provide a complete, continuous route from Innes Avenue to Crisp and Palou avenues. This access route accounts for the total auto capacity of the HPS site to connect with the surrounding neighborhoods and will be adequate to serve the development proposed as part of Major Phase 1 in Hunters Point

Shipyard. Internal streets proposed as part of Major Phase 1 in Hunters Point Shipyard would connect between Donohue Street and Innes Avenue.

TABLE 10 PROJECT STREET SEGMENT IMPROVEMENTS – HUNTERS POINT SHIPYARD							
Intersection	Improvement	Original Non-Stadium Option ^c		Modified Project			
		Traffic Volume Trigger? ^b	Trigger	Traffic Volume Trigger? ^b	Trigger ^d		
Palou Avenue, Griffith Avenue to Third Street	Resurface and Restripe, Streetscape Amenities	Yes	TBD - Based on Transit Phasing	No	HP-05 or Based on Transit Phasing to coincide with improved service frequencies		
Thomas Avenue, Ingalls Street to Griffith Street	Resurface and Restripe, Streetscape Amenities	Yes	3,131 PM Peak Hour Vehicle Trips (CP & HP) ^a	Yes	CP-07 ^e		
Griffith Street, Thomas Street to Palou Street	Resurface and Restripe, Streetscape Amenities	Yes	Reconstruction of Crisp Avenue	Yes	CP-07 ^e		
Innes Avenue, Donahue Street to Earl Street	Resurface and Restripe, Streetscape Amenities	Yes	1,000 PM Peak Hour Vehicle Trips	No	HP-02		
Crisp Avenue, Palou Avenue to Fischer Street	Resurface, Restripe, Realign	No	Adjacency	No	HP-01		
Innes Avenue/Hunters Point Boulevard/Evans Street, Earl Street to Jennings Street	Resurface and Restripe, Streetscape Amenities	Yes	1,000 PM Peak Hour Vehicle Trips	No	HP-02		
Donahue Street, LaSalle Avenue/Kirkwood Avenue to Crisp Road	Extend Street	N/A		No	None. Optional Improvement.		

a. Combined total from CP and HP

b. Based on trip rates by land use used in the EIR for Variant 1 (R&D).

c. As summarized in the FEIR (Comments and Responses, Appendix A4, Roadway and Transit Phasing Plan, Fehr & Peers, March 17, 2010

d. Where multiple triggers are provided, the trigger shall be whichever event occurs first. When a sub-phase is listed as the trigger, the improvement shall be fully constructed and operational prior to occupancy of the sub-phase.

e. Although these two segments are technically part of the HP improvements, they are part of an overall strategy to provide increased auto capacity between HP and CP and should be implemented simultaneously with other improvements on Carroll Avenue and Ingalls Street that are triggered by development in CP.

Figure 5 HP Major Phase 1

P

Figure 6 HP Major Phase 2

Figure 7 HP Major Phase 3
Mr. Jose Campos April 4, 2018 Page 35 of 68

Figures 6 and 7 illustrate that, other than the optional extension of Donahue Street to Crisp Avenue, subsequent phases would simply build out the internal roadway network adjacent to individual development parcels, all of which will connect to the major access routes. Therefore, the major pieces of auto infrastructure connecting Hunters Point Shipyard with the external roadway network will be constructed as part of Major Phase 1 in Hunters Point Shipyard, and therefore, auto capacity should be greater than or similar to what was described in the EIR during all phases of development.

As noted earlier, the Modified Project includes an optional extension of Donahue Street to provide a better connection between the northern and southern portions of Hunters Point Shipyard. The technical analysis conducted as part of this letter report does not include this extension.

However, the decision to implement this extension would not affect impact conclusions. For example, under conditions without the extension, traffic from the southern portion of Hunters Point Shipyard destined for Innes Avenue and points north would drive through the site, "around the hill" (likely via Fischer Street, Robinson Street, and Donahue Street) to reach Innes Avenue. With the extension, this traffic could simply drive along Crisp Road to Donahue Street and drive directly "over the hill" to Innes Avenue. Traffic on external roadways would likely be similar, and traffic within the site would likely be less, as there would be less need for circuitous travel within the site. Thus, if anything, the extension of Donahue Street would likely reduce congestion within the site.

As a result of the analysis described above, no new or substantially increased significant traffic impacts are expected as a result of the Modified Project or the modified phasing compared to the traffic impacts described in the EIR associated with FEIR Variant 1 (R&D), and therefore, no new mitigation measures are required. Conditions with mitigation measures described in the FIER (and as modified above) would continue to operate similarly to conditions described in the FEIR.

IMPACTS TR-17 THROUGH TR-30: IMPACTS TO LOCAL AND REGIONAL TRANSIT OPERATIONS AND CAPACITY

The EIR described the Project's impacts to transit in Impacts TR-17 through TR-30. Impacts TR-17 through TR-20 identified that, with implementation of the Project's Transit Operating Plan (identified as Mitigation Measure MM TR-17), the Project would provide adequate transit capacity locally, at the standard Downtown screenlines, and regionally to meet its projected demand. With implementation of MM TR-17, Impacts TR-17 through TR-20 were determined to be less than significant.

Mr. Jose Campos April 4, 2018 Page 36 of 68

The EIR also identified Impacts TR-21 through TR-27, which describe impacts to transit travel time associated with Project-generated traffic congestion on specific corridors affecting specific transit lines. Mitigation Measures MM TR-21 through MM TR-27 were identified and consist of three parts:

- Transit travel times should be monitored throughout the course of project buildout to determine whether Project-generated traffic is decreasing transit travel speeds.
- If speeds are decreasing, travel time reduction measures should be implemented on the affected corridors. These measures typically involve dedication of transit-only lanes.
- If reduction measures are either infeasible or not effective at improving travel speeds, new vehicles should be purchased to allow SFMTA to maintain planned service frequencies.

However, because implementation of these measures requires substantial additional outreach and design, the feasibility of these measures is uncertain, and Impacts TR-21 through TR-27 were determined to be significant and unavoidable.

The EIR also identifies Impact TR-28, a significant and unavoidable impact to SFMTA transit express routes using US 101 that may be slowed down by Project-generated freeway traffic for which no mitigation measures were identified. Impact TR-29 was identified as a less than significant impact to SFMTA transit express routes using I-280 because project-generated traffic on this route would not be as substantial. Impact TR-30 would be a significant and unavoidable impact to other regional transit routes (such as SamTrans express routes) using regional facilities to which the Project would contribute substantial amounts of traffic congestion.

The EIR concluded that Variant 1 (R&D) would have significant impacts to transit at the same locations as the FIER Project, but that Variant 1 (R&D) impacts would be more severe than the FEIR Project due to higher levels of traffic generated. No additional mitigation measures were required as part of Variant 1 (R&D), although the number of additional vehicles that may be required on the 48 Quintara was determined to be higher than that of the Proposed Project. Generally, the mitigation measures would be as effective at reducing the impacts to transit associated with Variant 1 (R&D) as they were forecasted to be at reducing the FEIR Project's impacts.

Similar to traffic impacts, the Modified Project's transit impacts at buildout as described in Impacts TR-17 through TR-30 will be similar to what was described in the EIR for Variant 1 (R&D), although two minor changes have been proposed. Specifically, the Modified Project proposes minor changes to the proposed routes for the 29 Sunset in Candlestick Point and to all routes in the Hunters Point Shipyard associated with a shift of the Hunters Point Shipyard Transit Center. As these routes were

Mr. Jose Campos April 4, 2018 Page 37 of 68

part of the Project's Transit Operating Plan, which was required as part of mitigation measure MM-TR-17, the changes described below, are considered changes to the mitigation measure itself (although no changes to the text of the measure in the FIER are required). Changes described herein have been developed in consultation with SFMTA. Refer to the original Transit Operating Plan, which was included as Appendix A to the Project's Transportation Plan, approved in 2010 as part of the FEIR Project for details on the original transit plan. Refer to the revised Transit Operating Plan, included as Appendix A to the Modified Project's Transportation Plan, which has been prepared as part of the Modified Project, for a more detailed presentation of the Modified Project's transit service plan.

The modification to the 29 Sunset was evaluated as part of EIR Addendum 1 (pp. 19-24), which found that the revisions to the route would offer similar or better transit service levels to the route evaluated in the EIR. The 29 Sunset routing proposed as part of the Modified Project is identical to those evaluated in Addendum 1 and approved by OCII and SFMTA.

Figure 8 illustrates the proposed changes to routes serving the Hunters Point Shipyard. The changes involve moving the Hunters Point Transit Center two blocks to the north from the original EIR proposal. The 28R BRT route and the 23 Monterey/24 Divisadero would travel an additional two blocks along Spear Street to reach the center. Routes approaching the Transit Center from Innes Avenue would travel along Lockwood Street to reach the Transit Center instead of Robinson Street, as originally proposed in the FEIR. Land uses along Lockwood Street and Robinson Street are relatively similar, so no change to transit mode share is expected as a result of this change. In Hunters Point South, transit (the 28R BRT and the 23 Monterey/24 Divisadero) would travel along Crisp Avenue along the northern edge of Hunters Point South. This is similar to the original EIR proposed routing in Hunters Point South.

Figure 8 Proposed Change to Hunters Point Shipyard Transit

Mr. Jose Campos April 4, 2018 Page 39 of 68

Transit Demand and Capacity

As shown in Tables 3 – 5 above, the changes contemplated as part of the Modified Project would slightly increase traffic demand and would not substantially change transit demand compared to FEIR Variant 1 (R&D) in the EIR. Furthermore, the proposed changes in routing are not likely to have an effect on mode share. Therefore, the proposed modifications will not likely result in additional or substantially more severe significant impacts beyond those identified in the EIR under buildout conditions as it relates to transit capacity impacts or delay associated with traffic congestion.

Transit Delay

Mitigation Measure MM TR-17, which calls for the project applicant to work with SFMTA to implement the proposed transit service increases would still apply. Mitigation Measures MM TR-21, MM TR-22, MM TR-23, MM TR-24, MM TR-25, MM TR-26, and MM TR-27, which call for the applicant and SFMTA to implement transit priority features or purchase new vehicles to maintain headways affected by Project-generated traffic congestion, would also still apply.

As noted in Table 3, the Modified Project would increase traffic volumes within the Hunters Point Shipyard site, possibly increasing delays to transit serving the Hunters Point Shipyard site. However, the Modified Project includes several features designed to ensure that transit within and around the Hunters Point Shipyard site is not adversely affected by increased traffic. Internal to the site, all transit would operate in transit-only lanes, as the Modified Project includes new transit only lanes along Lockwood Avenue that were not part of the FEIR Variant 1 (R&D), as well as the transit lanes along Crisp Avenue that have always been a part of the project.

External to the site, mitigation in the form of transit-only lanes was identified for the Palou Avenue routes in the FEIR, and monitoring is required to determine when/if the mitigation is needed. To the extent changes in Addendum 6 increase conflicts and delay to transit, the mitigation measure would simply be triggered sooner, as identified by the monitoring. Therefore, the delay to transit along Palou will not get worse than what the FEIR contemplated.

Similarly, the FEIR identified mitigation in the form of transit-only lanes along Evans Avenue. A similar monitoring program was established, such that if transit delays associated with the Modified Project are greater (or materialize more quickly in the buildout stages of the Modified Project) than

Mr. Jose Campos April 4, 2018 Page 40 of 68

identified in the FEIR, the mitigation measure would simply be implemented sooner, meaning that excessive transit delays would still be avoided.

Furthermore, although not required as part of the FEIR Variant 1 (R&D) or the Modified Project, a nearby development project that would develop within India Basin, along Innes Avenue, west of the HP site, has been proposed. A Draft EIR has recently been published for public review and comment, although as of the preparation of this analysis, the Draft EIR has not been certified nor has the associated project been approved. However, that project's Draft EIR identified a significant impact to transit associated with movements into and out of the India Basin project's site. The Draft EIR has called for conversion of one lane in each direction on Innes Avenue to transit-only as mitigation for the significant impact associated with that project. That measure, if approved, would ensure a continuous transit-only lane between the Modified Project's transit center and Third Street, potentially resulting in increased traffic congestion and more efficient transit service.

While implementation of the India Basin project's mitigation measure for transit-only lanes along Innes Avenue would be an additional benefit to transit, the analysis herein does not assume that mitigation measure to be in place because it has not yet been approved. If those transit-only lanes are not implemented, transit conditions along the Innes Avenue corridor would be similar to those identified in the FEIR for Variant 1 (R&D) as the amount of traffic increase along Innes Avenue associated with the Modified Project would be relatively small (i.e., less than 100) since the Modified Project represents a net increase of only approximately 280 vehicle trips in the PM peak hour compared to FEIR Variant 1 (R&D), and only approximately half of those trips would occur along Innes Avenue, and only a fraction of the trips along Innes Avenue would occur in the peak direction.

Transit Phasing

Similar to the Project's roadway infrastructure, the Project's transit network was proposed to be implemented at various levels throughout the development as described in the Transit Operating Plan. As a result of proposed changes to the development phasing, the transit phasing has been modified in order to ensure that the appropriate transit service is provided throughout the development as currently envisioned. Mitigation Measure MM TR-17 notes that the transit operating plan may be modified from what was approved in the EIR "to address changes in the operating environment and service demands" based on SFMTA's planning methodology and public input if modifications result in:

Mr. Jose Campos April 4, 2018 Page 41 of 68

- Similar or higher transit mode share to what was projected in the EIR
- Adequate capacity to serve projected transit ridership
- Similar or less severe traffic impacts to those identified in the EIR

Although the changes to the Transit Operating Plan are not specifically to address current or observable changes in the operating environment and service demands, the Project Sponsor and SFMTA believe that the proposed changes to development phasing would affect the future operating environment and service demands, and thus propose changes to the Transit Operating Plan to better meet future demands consistent with the Mitigation Measure MM TR-17 provisions.

The FEIR Project and Modified Project transit phasing are shown in **Table 11**. **Appendix F** includes detailed comparison of the approximate number of transit trips (and approximate level of development) that would be in place at the time each level of transit service would be implemented under the FEIR Project and the Modified Project. Generally, changes to the transit phasing delay the provision of transit service to the Hunters Point Shipyard site, due to the delay in development there. In response to the acceleration of planned development in Candlestick Point, transit service at Candlestick Point would be accelerated. Overall, the revised phasing has been developed in collaboration with SFMTA service planning staff to retain a relatively close approximation to the level of transit demand that would be generated for each level of transit service between the FEIR Project and Modified Project, combined with engineering judgment to account for the unique development phasing currently proposed.

Additional analysis demonstrating that the levels of transit service relative to development would result in similar effectiveness to the analysis in the FEIR is provided later in this section. **Figures 9** – **11** show the phasing of transit and bicycle infrastructure relative to the three Major Phases of development at HP. (Phasing of transit and bicycle infrastructure at CP is relatively similar to what was assessed in Addendum 1, and therefore, no additional detail is provided here).

CP-01, CP-03, and CP-04 are currently slated to be first sub-phases completed as part of Major Phase 1. They consist of residential and neighborhood-serving retail uses. The primary transit service likely to be used by residents in CP is express bus service to Downtown San Francisco. Thus, as part of these sub-phases (currently scheduled to be completed by approximately 2021), the Candlestick Point Express (CPX) bus route will be initiated. Because of the relatively high number of residential units comprising these sub-phases, the CPX will start out at 15-minute headways and then quickly increase to 10-minute headways.

Notes:

a) Approved Transit Operating Plan called for service increases to 12-minute headways. This has been revised to 10-minute headways as part of the Modified Project.

b) The 23 Monterey service may extend into HPS until SFMTA's fleet is modified to eliminate the need for OCS wires extended into the HPS site, at which point the 24 Divisadero would be extended and the 23 Monterey would return to its original (existing) routing. Note that the Approved Transit Operating Plan also called for three levels of service, corresponding to 15-, 10-, and 7.5-minute frequencies. The Modified Transit Operating Plan has been changed to reduce service levels somewhat on this route and increase service levels on express bus routes based on direction from SFMTA staff.

c) Temporary until initiation of BRT

d) Although the anticipated development schedule calls for the first portions of HP-01 to be completed in 2019, that portion is primarily reconstruction of existing artists' studios. The first portion of new development is scheduled to be complete by approximately 2021, which is when new transit service would likely be warranted.

Mr. Jose Campos April 4, 2018 Page 46 of 68

To serve the retail center planned as part of CP-02, currently scheduled for completion around 2022, the 29 Sunset would be extended to the retail center. The FEIR also assumed the 28R BRT route would be operational prior to opening of the CP retail center. Because the opening of the retail center is currently proposed to be sooner relative to the rest of the development in the Project, SFMTA has indicated that operating the 28R BRT route is not possible in the near term, because of fleet requirements and infrastructure needs (both the Yosemite Slough Bridge and a workable routing west of US 101 prior to completion of the Geneva Interchange Project).

Addendum 1 modified the Transit Operating Plan to include a privately-funded shuttle, available complimentary for the general public, including existing neighbors, future residents, and shopping center patrons and employees, to provide service between the project site and the Balboa Park BART station, replicating service that will ultimately be offered by the 28R BRT route. This shuttle would be provided by the Project Sponsor or other on-site tenant. Service will be offered at 7.5 minute frequency with approximately 30-passenger vehicles. This service will be interim service until the 28R BRT route, or other comparable transit service is implemented. Although the shuttle service will initially be oriented to the Balboa Park BART Station, the site's TDM coordinator will retain the ability to reroute the shuttle to other regional transit hubs to better match patron and employee demand, with the mutual agreement of the Environmental Review Officer. This shuttle service will remain in the Transit Operating Plan as part of the Modified Project.

Addendum 1 also modified the Transit Operating Plan to include a temporary extension of the 56 Rutland route into the CP site to provide additional connections to Caltrain and other regional transit. However, that modification called for the extension to be implemented temporarily, only until such time as the CPX was implemented. Since the Modified Project phasing includes implementation of the CPX early on, the 56 Rutland extension would no longer be necessary, and that would be removed from the Transit Operating Plan, consistent with the original FEIR Transit Operating Plan.

Figures 12 and 13 summarize the level of transit supply proposed to be implemented over time relative to the expected transit ridership demand, based on the development phasing schedule and the transit implementation triggers described above, for Candlestick Point and Hunters Point Shipyard, respectively. **Appendix F** provides a year-by-year summary of anticipated development, auto trip generation, and transit trip generation for the Candlestick Point and Hunters Point Shipyard sites, which, along with anticipated transit phasing described in Table 9, formed the basis for **Figures 12 and 13**.

Mr. Jose Campos April 4, 2018 Page 47 of 68

Mr. Jose Campos April 4, 2018 Page 48 of 68

The figures illustrate that with the proposed changes in development and transit phasing, the level of transit service proposed over time increases roughly in proportion to (and where possible, in advance of) increases in development and associated transit demand. **Figure 12** illustrates that with the Modified Project development schedule and transit phasing, the level of transit service relative to demand will always remain substantially higher than the demand at the Candlestick Point site. For example, the transit service capacity increases substantially in 2021 and 2022, coincident with substantial increases in demand over those same two years. Transit service increases again in 2025, in advance of increases in demand in years 2027 through 2030. The alignment of transit service increases with land use development throughout the development process and at buildout, means the transit will remain an attractive option for travelers in the area.

Figure 13 similarly illustrates that transit service relative to development at Hunters Point Shipyard will generally increase along with, and where possible, in advance of development.

Therefore, transit capacity will be adequate to serve the expected demand, and the mode split (i.e., the percentage of trips made by transit) should remain similar, meaning that there will not be additional significant transit impacts beyond those described in the EIR, nor will the Modified Project substantially increase the severity of significant impacts identified in the FIER, and no additional mitigation measures are required.

IMPACT TR-31 AND TR-32: BICYCLE CIRCULATION

The EIR identified Impacts TR-31 and TR-32 to bicycle circulation. Impact TR-31 generally describes the overall improvement to the areawide bicycle network that would result from the Project. Impact TR-32 describes a significant impact to Bicycle Routes #70 and #170 on Palou Avenue that would be adversely affected by the substantial increases to transit service along this street. Mitigation Measure MM TR-32 calls for relocating the bicycle routes to another nearby street with fewer conflicts, although the measure does not specify where the bicycle facilities should be relocated to.

As noted in the EIR, bicycle facilities are typically categorized as one of four "classes." A Class I facility is a dedicated, off-street space for bicycles to operate without interference from cars, except at intersections. Class I facilities can be one-way or two-way, and can also be shared with pedestrians in some cases. Class II facilities are on-street striped bicycle lanes, which allocate specific space on the street for bicycle use only. Class III facilities are bicycle routes, which do not allocate space dedicated for bicycles, but often include signage and "sharrow" pavement markings

Mr. Jose Campos April 4, 2018 Page 49 of 68

alerting drivers to the likely presence of bicycles. Class IV facilities are exclusively for the use of bicycles and are separated from adjacent auto traffic lanes.

As shown in **Figures 14 and 15**, the Modified Project includes refinements to the proposed bicycle network. Many of these changes – particularly those in Candlestick Point – were addressed in and approved as part of Addendum 1 (pp. 25-27), and would not be changed further as part of the Modified Project being assessed herein. Therefore, they are not discussed further here.

The primary change to the bicycle network in the Modified Project compared to the changes approved as part of Addendum 1 is the re-alignment of the cycletrack in Hunters Point Shipyard South. One of the primary modifications approved as part of Addendum 1 was a new two-way cycletrack connecting the Hunters Point Shipyard and Candlestick Point neighborhoods. Within Hunters Point Shipyard, the cycletrack was to travel along the northern side of Crisp Avenue.

However, the Modified Project proposes an institutional/educational use and some R&D uses on the northern side of Crisp Avenue, which may require driveways or other curb cuts that may disrupt the cycletrack. Therefore, the Modified Project proposes to align the cycletrack through the open space and park area south of Crisp Avenue, and along one of the midblock breaks in HPS South. From there, it would extend across the new bridges across Drydock 4, where it would connect to the planned portion of the Bay Trail traversing the perimeter of HPS and with proposed facilities on Robinson Street. The facility on Robinson Street would be constructed as a Class IV separated facility providing an additional buffer between cyclists and adjacent traffic. These changes would ensure a more direct route between HPS and CP, and would ensure a complete connection within HPS, and to proposed cycletrack facilities west of HPS, within the proposed India Basin project. As a result, the modified Project would provide a more complete and connected network of routes and facilities, and would penetrate through the center of HPS South, instead of along its northern edge as had previously been contemplated.

Figure 14 Originally Approved Bicycle Network

Mr. Jose Campos April 4, 2018 Page 52 of 68

Overall, the project refinements would continue to improve the overall bicycle network in the study area and facilities will be adequate to meet bicycle needs and Impacts TR-31 and TR-32 would remain unchanged. Mitigation Measure MM TR-32 would also still apply, and as part of the requirements of MM TR-32, SFMTA has already initiated conversations with the Project Sponsor regarding a study to consider relocating the existing bicycle route on Palou Avenue to Quesada Avenue, immediately to the south, and part of the City's Green Connections project. As noted in the EIR, this study must be complete prior to issuance of the grading permit for Major Phase 1 at Hunters Point Shipyard. No new significant impacts beyond those identified in the EIR would result from the Modified Project and the Modified Project would not make bicycle impacts substantially more severe than identified in the FIER, and therefore, no additional mitigation measures are required.

IMPACTS TR-33 AND TR-34: PEDESTRIAN CIRCULATION

The EIR identified Impacts TR-33 and TR-34 and determined that the Project would cause less than significant impacts on pedestrian circulation. The Modified Project generally maintains the project's goals of prioritizing the pedestrian realm through provision of generous sidewalks with streetscape amenities and safety measures, such as bulbouts at key locations. As noted earlier, sidewalks would generally remain between 12 and 15 feet, within the range of sidewalks considered in the original plan.

Overall, the Modified Project includes minor changes with respect to the pedestrian realm, such as slightly modified sidewalk widths and reoriented streets as shown in Appendix D and impacts are expected to be similar to Impacts TR-33 and TR-34, as described in the EIR and no new significant impacts or mitigation measures would be required.

IMPACTS TR-35 AND TR-36: PARKING

The EIR identified Impacts TR-35 and TR-36, which determined that although the Project would result in a shortfall of parking spaces compared to its projected demand and would remove some existing on-street parking spaces, the Project's impacts to parking conditions would be less than significant. The Modified Project may result in slightly fewer parking spaces on-street than the maximum envelope anticipated as part of FEIR Variant 1 (R&D). Specifically, the EIR identified that Variant 1 (R&D) would include approximately 3,000 on-street parking spaces (roughly evenly split between Candlestick Point and Hunters Point Shipyard) and between zero and approximately

Mr. Jose Campos April 4, 2018 Page 53 of 68

20,000 off-street spaces. Therefore, the EIR concluded there would be a range of between approximately 3,000 spaces and 23,000 spaces in the entire development area.

The Modified Project would reduce on-street parking supply by up to several hundred spaces between Candlestick Point and Hunters Point Shipyard based on more detailed designs prepared as part of subphase applications and the desire to provide separated bicycle facilities along Robinson Street. (A precise count is unknown because the actual number of spaces that would have been provided cannot be determined until more detailed final designs are complete). Although the range of off-street parking spaces constructed was projected to be between zero and approximately 20,000 spaces in the FEIR, it is reasonable to expect that the Modified Project will build at least as many off-street spaces as would be removed through the minor design changes, such that with the loss of a few hundred on-street spaces, the Modified Project will still contain between 3,000 spaces and total 23,000 spaces.

Furthermore, **Table 12**, below, compares the maximum amount of parking allowed for FEIR Variant 1 (R&D) and the maximum amount that would be allowed for the Modified Project as described herein. As shown, there would be an overall increase in the maximum spaces allowed at Hunters Point Shipyard of 737 spaces and a corresponding decrease in the maximum amount of parking allowed at Candlestick Point of 242 spaces. The resulting maximum total of parking allowed within the Modified Project would be 495 more spaces than allowed under FEIR Variant 1 (R&D).

Therefore, since the Modified Project will still provide parking within the range identified in the EIR, or possibly very slightly above it, conclusions in the EIR related to parking, as described in Impacts TR-35 and TR-36, remain valid, no new significant impacts have been identified, and no new mitigation measures would be required.

		MAXIMUM A	TABLE 12		1	
	FEI	R Variant 1 (R8	kD)	Ν	Aodified Projec	t
	СР	НР	Total	СР	НР	Total
On-Street	1,360	1,678	3,038	1,360	1,487	2,847
Off-Street	10,196	9,678	19,874	9,954	10,606	20,560
Total	11,556	11,356	22,912	11,314	12,093	23,407
Source: Canc (2018)	llestick Point-H	unters Point Sh	ipyard Phase II	Development I	Plan EIR (2010)	and FivePoint

IMPACT TR-37: LOADING

The EIR identified Impact TR-37 and determined that the Project would provide adequate loading supply and therefore concluded that impacts related to loading would be less than significant, and that no mitigation measures would be required. As the modified Project does not change the overall loading requirements, implementation of the Modified Project would not result in any new significant impacts related to loading and no new mitigation measures would be required.

IMPACTS TR-38 THROUGH TR-50: STADIUM IMPACTS

The EIR included a number of impacts related to operation of the proposed new NFL stadium in the Hunters Point Shipyard site. However, the stadium is not part of the modified Project and these impacts and associated mitigation measures no longer apply.

IMPACT TR-51 THROUGH TR-55: ARENA IMPACTS

The EIR determined that the Project's proposed Arena use would create new impacts. Specifically, Impact TR-51 noted that the arena component of the Project would create significant and unavoidable traffic and site access impacts, and required development of an event Transportation

Mr. Jose Campos April 4, 2018 Page 55 of 68

Management Plan (TMP) by the arena operator as Mitigation Measure MM TR-51. However, even with MM TR-51, the arena's impacts to site access and traffic would be significant and unavoidable. The EIR also identified as part of impact TR-52, that the arena's traffic generation would have significant impacts to transit operation and identified Mitigation Measure MM TR-23.1 (operational improvements to the 29 Sunset route) as a way to reduce the effects of the arena traffic on the 29 Sunset travel times. However, even with implementation of these two mitigation measures, the EIR concluded that the arena's impacts to traffic congestion and transit operations would remain significant and unavoidable.

The EIR also determined that the arena would have a less than significant impact to bicycle circulation (TR-53), pedestrian circulation (TR-54), and parking conditions (TR-55).

The Modified Project would not change the project with respect to the arena. Thus, the "event conditions" impacts associated with the arena would be essentially the same as identified in the FEIR. The Modified Project would not create any new significant impacts or substantially increase the severity of a significant impact associated with events at the arena compared to what was described in the EIR, and therefore no additional mitigation measures are required, although the previously-identified mitigation measures would continue to apply.

IMPACT TR-56: AIR TRAFFIC IMPACTS

The EIR determined that the Project would have a less than significant impact on air traffic. The modified Project would contain the same overall land uses and general development form and would not change the EIR's conclusion regarding air traffic. The modified Project would not create any new significant impacts with respect to air traffic and no additional mitigation measures are required.

IMPACT TR-57: HAZARDS DUE TO DESIGN FEATURES

The EIR determined that the Project's transportation infrastructure would be designed in accordance with City standards, and would be reviewed and approved by the City prior to construction. As a result the Project's impacts to hazards would be less than significant. The modified Project would also be designed accordance with City standards and would be reviewed and approved by the City. Therefore, no new significant impacts to design features have been identified and no mitigation measures are required.

Mr. Jose Campos April 4, 2018 Page 56 of 68

IMPACT TR-58: EMERGENCY ACCESS

The EIR determined that the Project's transportation infrastructure would adequately facilitate emergency access and be designed to City standards, which include provisions that address emergency vehicles. The modified Project would also be designed accordance with City standards and would be reviewed and approved by the City. Therefore, no new significant impacts to emergency access have been identified and no mitigation measures are required.

CUMULATIVE IMPACTS

As noted in the EIR, the discussion of cumulative impacts was included with the discussion of project-related impacts in Impacts TR-1 through TR-58 and no additional cumulative impact discussion is necessary. Similar to what is described above and in the EIR, since the modified Project would generate similar levels of travel demand at buildout and would have a similar transportation infrastructure, the modified Project's contribution to cumulative impacts would be the same as what is described in the EIR.

VMT ANALYSIS (FOR INFORMATIONAL PURPOSES ONLY)

Subsequent to certification of the FEIR in 2010, and consistent with guidance from the State of California Office of Planning and Research (OPR)⁹, the San Francisco Planning Commission adopted Planning Commission Resolution 19579 in March 2016 modifying the City's environmental review process by:

"removing automobile delay, as described solely by level of service or similar measures of vehicular capacity or traffic congestion, as a significant impact on the environmental [sic] pursuant to the California Environmental Quality Act, and replace it with vehicle miles traveled criteria which promote the reduction of greenhouse gas emissions, the development of multimodal transportation networks, and a diversity of land uses."¹⁰

As a result of this change, project-related effects on congestion are no longer considered significant traffic-related impacts for projects where the San Francisco Planning Department is the Lead

⁹ California Office of Planning and Research, *Revised Proposal on Updates to the CEQA Guidelines on Evaluating Transportation Impacts in CEQA*, January 20, 2016

Mr. Jose Campos April 4, 2018 Page 57 of 68

Agency. Instead, the City of San Francisco replaced level of service as a metric with a new vehiclemiles traveled (VMT) metric and threshold.

However, since OCII is the Lead Agency for this project, and OCII has not adopted such a revised significance metric and threshold, effects on traffic congestion are still considered in the analysis, as described above. However, because the project is nearby other projects that have recently undergone environmental under the Planning Department's purview, this section presents a discussion of the Modified Project's effects on VMT for informational purposes only.

Background

Many factors affect travel behavior. These factors include density, diversity of land uses, the design of the transportation network, access to regional destinations, distance to high-quality transit, development scale, demographics, and transportation demand management. Typically, low-density development at great distance from other land uses, located in areas with poor access to nonprivate vehicular modes of travel, generate more automobile travel compared to development located in urban areas, where a higher density, mix of land uses, and travel options other than private vehicles are available.

Given these travel behavior factors, San Francisco has a lower VMT ratio than the nine-county San Francisco Bay Area region. In addition, some areas of the City have lower VMT ratios than other areas of the City. These areas of the City can be expressed geographically through transportation analysis zones. Transportation analysis zones are used in transportation planning models for transportation analysis and other planning purposes. The zones vary in size from single city blocks in the downtown core, multiple blocks in outer neighborhoods, to even larger zones in historically industrial areas like the Hunters Point Shipyard.

The San Francisco County Transportation Authority (Transportation Authority) uses the San Francisco Chained Activity Model Process (SF-CHAMP) to estimate VMT by private automobiles and taxis for different land use types. Travel behavior in SF-CHAMP is calibrated based on observed behavior from the California Household Travel Survey 2010-2012, Census data regarding automobile ownership rates and county-to-county worker flows, and observed vehicle counts and transit boardings. SF-CHAMP uses a synthetic population, which is a simulated set of individual actors that represents the Bay Area's actual population, who make simulated travel decisions for a complete day. The Transportation Authority uses tour-based analysis for office and residential uses, which examines the entire chain of trips over the course of a day, not just trips to and from the

project. For retail uses, the Transportation Authority uses trip-based analysis, which counts VMT from individual trips to and from the project (as opposed to entire chain of trips). A trip-based approach, as opposed to a tour-based approach, is necessary for retail projects because a tour is likely to consist of trips stopping in multiple locations, and the summarizing of tour VMT to each location would over-estimate VMT.^{11,12}

Although not directly applicable to this analysis because the San Francisco Planning Department is not the lead agency, the Planning Department's threshold of significance for the new VMT metric states that:

- The project would have a significant adverse impact if it would cause major traffic hazards.
- The project would have a significant effect on the environment if it would cause substantial additional VMT.
- The project would have a significant effect on the environment if it would substantially induce additional automobile travel by increasing physical roadway capacity in congested areas (i.e., by adding new mixed-flow lanes) or by adding new roadways to the network.

Specifically, Planning Commission Resolution 19579 and supporting materials provide direction for analyzing transportation conditions and identifying the transportation impacts of a proposed project in San Francisco based on the following:

For residential projects, a project would generate substantial additional VMT if it exceeds the regional household VMT per capita minus 15 percent.¹³ For office projects, a project would generate substantial additional VMT if it exceeds the regional VMT per employee minus 15 percent. As documented in the *Revised Proposal on Updates to the CEQA*

¹¹ To state another way: a tour-based assessment of VMT at a retail site would consider the VMT for all trips in the tour, for any tour with a stop at the retail site. If a single tour stops at two retail locations, for example, a coffee shop on the way to work and a restaurant on the way back home, then both retail locations would be allotted the total tour VMT. A trip-based approach allows us to apportion all retail-related VMT to retail sites without double-counting.

¹² San Francisco Planning Department, Executive Summary: Resolution Modifying Transportation Impact Analysis, Appendix F, Attachment A, March 3, 2016.

¹³ OPR's proposed transportation impact guidelines states a project would cause substantial additional VMT if it exceeds both the existing City household VMT per capita minus 15 percent and existing regional household VMT per capita minus 15 percent. In San Francisco, the City's average VMT per capita is lower (8.4) than the regional average (17.2). Therefore, the City average is irrelevant for the purposes of the analysis.

Mr. Jose Campos April 4, 2018 Page 59 of 68

Guidelines on Evaluating Transportation Impacts in CEQA ("proposed transportation impact guidelines"), a 15 percent threshold below existing development is "both reasonably ambitious and generally achievable." ¹⁴ For retail projects, the Planning Department uses a VMT efficiency metric approach for retail projects: a project would generate substantial additional VMT if it exceeds the regional VMT per retail employee minus 15 percent. For mixed-use projects, each proposed land use is evaluated independently, per the criteria described above.

VMT Assessment

Table 13, below, presents the existing and future year VMT per capita rates for the Bay Area region and for the TAZs at CP and HP that include the Modified Project for both existing conditions and future year 2040 conditions. For residential development, the regional average daily VMT per capita is 17.2.¹⁵ For office and retail development, regional average daily work-related VMT per employee is 19.1 and 14.9, respectively.

The Candlestick Point portion of the Modified Project includes residential, office, retail, hotel, and community services uses, plus an arena. The City considers VMT associated with hotel uses to be similar to residential. The arena has components that function similarly to retail and office. The community services are still somewhat undefined, but will likely also function similarly to retail. Therefore, the evaluation of the three primary land use categories for which data is available from the City adequately covers VMT patterns associated with all land uses at Candlestick Point.

As shown, at Candlestick Point, the VMT per capita for residential and retail uses are currently below the City's threshold of 15 percent below the regional average. VMT per capita for office uses at CP would currently exceed the threshold. However, by year 2040, all three land use types would generate VMT per capita substantially below the regional average and less than the City's threshold of significance. This is because the increased density associated with the Modified Project reduces the need for people to travel outside of the area for goods and services, and also because the substantial investment in transit service to the site reduces the need for people to travel to and from the site by automobile. So, buildout of the Modified Project itself would reduce the VMT at the site such that it would not exceed the thresholds.

¹⁴ This document is available online at: <u>https://www.opr.ca.gov/s_sb743.php</u>, page III:20.

¹⁵ Includes the VMT generated by the households in the development.

Notes:

1. VMT rates exceeding the respective threshold are shown in **bold**.

2. The SF-CHAMP model land use assumptions for TAZ 387 assume primarily office and retail land uses, and do not include residential uses. Thus, the model reports a residential VMT per capita of 0.0 in TAZ 387 for year 2040, and similarly, reports an atypically high rate of VMT generation for retail uses (which derive a large portion of trips from residential uses). However, since the mix of uses actually proposed in that TAZ are more similar to those assumed in the model for TAZ 386, the VMT forecasts for TAZ 386 are likely representative of what would occur at TAZ 387 as well, all of which would be well below the City's threshold.

Source: <u>www.sftransportationmap.org</u> (accessed December 29, 2017)

Mr. Jose Campos April 4, 2018 Page 61 of 68

At the Hunters Point Shipyard site, the Modified Project includes residential, retail, office/R&D, community services, a hotel, educational uses, a marina, and artists' studios. As with Candlestick Point, the community services uses will likely function similar to retail and the hotel will function similarly to residential. The artists' studios will function similarly to office in some respects and retail in other respects. The City considers educational uses to function similarly to office uses. Finally, the marina will function similarly to a recreational use, which the City considers to operate similar to retail. Thus, similar to Candlestick Point, all uses proposed at Hunters Point can be approximated using the three primary uses the City provides VMT data for.

As shown in Table 13, at Hunters Point Shipyard, the VMT per capita for retail uses is currently below the City's threshold of 15 percent below the regional average. VMT per capita for residential uses in HP North area also currently below the City's threshold. VMT per capita for office use in HP North and for both office and residential uses at HP South and the R&D area would currently exceed the threshold.

However, by year 2040, according to SF-CHAMP, all office and residential uses would be within the threshold, retail uses at HP North would be within the City's threshold, but retail uses at HP South and the R&D area would exceed the City's threshold. Land use assumptions in SF-CHAMP for TAZ 387 assume primarily office and retail land uses, and do not include residential uses. Thus, the model reports a residential VMT per capita of 0.0 in TAZ 387 for year 2040, and similarly, reports an atypically high rate of VMT generation for retail uses (which derive a large portion of trips from residential uses). However, the Modified Project would include office, retail, and residential in both TAZ 386 and 387. Since the mix of uses actually proposed in TAZ 387 is more similar to those assumed in the model for TAZ 386, the VMT forecasts for TAZ 386 are likely representative of what would occur at both TAZ 386 and 387, and therefore, the VMT per capita generated by the Modified Project in both Hunters Point Shipyard would be within the City's threshold.

Mr. Jose Campos April 4, 2018 Page 62 of 68

CONCLUSION

In conclusion, the Modified Project would not change or alter any of the EIR's findings with respect to transportation impacts. All impacts would remain less than significant, less than significant with mitigation, or significant and unavoidable, as previously identified, and no new mitigation measures would be required. Additionally, the EIR's transportation cumulative impact conclusions would not be altered.

We hope you have found this useful.

Sincerely,

FEHR & PEERS

Cis Mitter

Chris Mitchell, PE Principal

Mr. Jose Campos April 4, 2018 Page 63 of 68

SOURCE: 2010 Project Data: Table II-3 & Table II-6 of the FEIR.

^a All infrastructure is excluded from the development program's square footage, with the exception of any associated office space, which is included in the R&D/Office category.

^b Includes 400 high school students living on campus

^c Includes 600 high school students and 400 college students. Half the high school students would be on site at any one time. One-third of the college students would be on site at any one time.

^d The 2010 FEIR indicates that R&D uses are defined to include research and development, office, and light-industrial uses. Under the 2018 Modified Project Variant land use program, in CP, 150,000 sf of uses are designated as office uses, while in HPS2, 4,265,000 sf of uses are designated as R&D uses. ^e Converts R&D/Office qsf to Retail at CP; converts R&D/Office qsf to Institution at HPS2.

^f Includes 71,000 square feet of approved (but not constructed) commercial space from HPS1 to HPS2.

⁹ Includes 172 approved (but not constructed) housing units from HPS1, increasing the overall unit count for CPHPS2 from 10,500 to 10,672.

^h On-street parking is in addition to structured parking.

¹ Specific acreages for Other Parks were not provided in the 2010 FEIR. In addition, Other Parks are included for information purposes only; they are not included in the final calculation of parks and open space.

^g Includes 172 approved (but not constructed) housing units from HPS1, increasing the overall unit count for CPHPS2 from 10,500 to 10,672.

^h On-street parking is in addition to structured parking.

¹ Specific acreages for Other Parks were not provided in the 2010 FEIR. In addition, Other Parks are included for information purposes only; they are not included in the final calculation of parks and open space.

SOURCE: 2010 Project Data: Table IV-19a & Table IV-21a of the FEIR.

^a All infrastructure is excluded from the development program's square footage, with the exception of any associated office space, which is included in the R&D/Office category.

^b Includes 400 high school students living on campus

^c Includes 600 high school students and 400 college students. Half the high school students would be on site at any one time. One-third of the college students would be on site at any one time.

^d The 2010 FEIR indicates that R&D uses are defined to include research and development, office, and light-industrial uses. Under the 2018 Modified Project Variant land use program, in CP, 150,000 sf of uses are designated as office uses, while in HPS2, 4,265,000 sf of uses are designated as R&D uses.

 $^{\rm f}$ Includes 71,000 square feet of approved (but not constructed) commercial space from HPS1 to HPS2.

^g Includes 172 approved (but not constructed) housing units from HPS1, increasing the overall unit count for CPHPS2 from 10,500 to 10,672.

^h On-street parking is in addition to structured parking.

¹ Specific acreages for Other Parks were not provided in the 2010 FEIR. In addition, Other Parks are included for information purposes only; they are not included in the final calculation of parks and open space.

¹ Earliest Start Date ² Earliest Closing Start Date

¹ Santa Start Date
³ Last Closing Start Date
⁴ Entitled 150,000 SF, however Business Plan projects 130,000 SF for Hotel
⁵ 46,000 SF of PAC allocated to CP-3. Performance Venue entitlement (29,000 SF) is currently unallocated.
⁶ Entitled 131,000 SF, however Business Plan projects 129,188 SF for Neighborhood Retail with balance to be relocated elsewhere within CP ⁷ Entitled for 2,630 parking spaces

ASSUMPTIONS Horizontal duration includes abatement, demolition, grading and horizontal infrastructure Vertical duration includes foundation, piles, structure, rough in, interior and exterior finishes, through full occupancy Shoreline construction will be done concurrently with adjacent park improvements
